Hi

Could you help me with the following disparity between the published factor weight file and SPSS dataset for Rwanda MIS 2013.

The factor weight file for Rwanda MIS 2013 has 1196 respondents on the urban tab while the household recode dataset has 837 urban respondents according to HV025 (the urban/rural variable). The means for variables in the urban tab and according to the dataset are also different.

Thanks,

Kenzo
