I am using DHS data for Zimbabwe 2010-2011. I have been naming some variables in
ZWHR62FL. Now i want to work on file ZWIR62FL. The issue is I would like to merge the two
files. I prefer renaming for easy understanding. Is it possible to combine data in household file to
household members file and then to women file? I noted that to merge household data to
women`s data requires renaming eg HV001 to V001. Does it mean that the I have to rename
HV001 and HV002 only or other variables of interest also? Is it correct to rename "source of
drinking water" in the women`s data and that in the household file data the same? When the
survey is done, is one questionnaire used to prepare the various data files, for instance, questions
asked a household member (female), is it the same member who is also asked for the women`s
data.

Am looking at the impact of women empowerment on reproductive health. With education being
the proxy for women empowerment, which variables from the DHS maybe the best to use?

Am a new learner and Stata is also new, so please bear with me.

I would only change the names of the variables that you are going to merge on, i.e. the unique
identifiers. Otherwise, if two variables are the same name in both datasets, Stata will keep only
the master dataset's values, and that may not necessarily be what you want:

Quote:By default, merge treats values from the master as inviolable. When observations match, it
is the
master's values of the overlapping variables that are recorded in the merged result.

(From the Stata Data Management Reference Manual, section "Treatment of overlapping
variables")

Since you are a beginner Stata learner, I encourage you to visit IDRE at UCLA's Stata resources
page and also by looking at the help files of the commands you want to use by typing "help
[command]" into the command window, for example help merge .
