Hi, I am using the Palestinian 2004 DHS, which, I am aware, is not an official DHS. Still, I thought that someone might be able to help. Sadly, the variable names do not follow standard DHS conventions, which is evident in my explanation below.

I am trying to merge the children's vaccination data (in file vaccination) with their mothers demographic data. This should be a trivial task since there is supposed to be a variable linking the vaccination data to the birth history records. The question IM02 in the questionnaire recorded the "line number of the individual in the birth history", but this variable is not available in the "vaccination" file. I spent a couple of hours trying to find the variable or another way of finding the mother's data for the children in the vaccination file, but I was unable to find a direct way. I can link the records in the "vaccination" file with the HH roster data via the idh00 variable (questionnaire number) and the hr01 variable (line number in household). But all I can gather from this is that the children live in the same household as the mother, not who is the child of whom.

In summary, I am sure the files should be linked through a common variable. The relevant variable linking the vaccination data to the birth history (IM02) was asked in the questionnaire but is for some reason missing from the data.

Has anyone worked with these data before or has any suggestions on this?

I'm sorry, but we have no experience with this dataset, so we can't suggest solution. I suggest writing to the Palestinian agency from which you received the dataset.
