Hi there,

Reading through other forum posts I've noticed recommendations for merging the HIV dataset to the women's dataset using HIVNUMB HIVCLUST and HIVLINE variables. These variables appear not to exist in the DRC hiv dataset. Are there other variables I would be able to match on? I'm specifically need to merge the HIV data to the dataset containing the IPV module.

Thanks

I just checked the dataset, and the variables do exist. See the list of variables in CDAR61.ZIP below:
