Hi all,

I am new to DHS. I am using the DHS2015 for Rwanda for some background stats on education. I have downloaded all data sets (flat). I then looked into the questionnaire used as I found it in the DH2015 Rwanda country report. However, in the questionnaire I found some questionnaires of interest that I could not spot in the data set. For example question 567 in the women's questionnaire ("I am interested in learning about the things that (name) plays with when he/she is at home.").

I tried to find the variable name in the flat-structured data set by searching for it using the 'STANDARD RECODE MANUAL for DHS 6' (<http://www.dhsprogram.com/publications/publication-dhsg4-dhs-questionnaires-and-manuals.cfm>). I basically used the search function and key words (plays or toys etc.) However to no avail. I cannot believe that they do not provide the full data set. Therefore my questions: What is the most elegant way to locate questions in the data set? Why cannot I not locate the question 567 mentioned above?

Thanks so much!

Dom

Dear User,

Please look for variables:

S567A Does child play with homemade toys

S567B Does child play with toys from store

S567C Does child play with household objects

These are survey/country specific variables. In most cases you will be able to find them starting with the letter "S" but with the same number as in the questionnaire. Also there is a list of all country specific variables in the documentation distributed with the data you downloaded. This document is an MS Word document called RWIR70.doc

Thank you!
