Dear all,

We always generate both, the old and the latest (2012) versions of the Family Planning Need Satisfied indicator. The old one is based on v626; the latest one, on v626a.

Generally these indicators have very similar estimates, but we got very different results from this survey.

Our estimate using v626a matches the published one (81.9%); however the old definition estimate was 97.4%, which is not consistent.

Analyzing more carefully the variables v626 and v626a, we found out that a great number of women are coded as infecund/menopausal in the old definition (v626), but coded in diverse categories in v626a:

Is it a problem in the dataset?

Thank you!

Best wishes,

Fernanda

Yes, it is a problem in the dataset for v626. v626A looks fine. We will look to correct and re-issue the dataset.
