Subject: How to generate proportion of women reporting to have used contraceptives at regional level

I am trying to generate some variables from the Tanzania Demographic Health Survey Data. The variables are average breastfeeding duration at the regional level/provincial level and proportion of women reporting to have ever used contraceptives. I want to use the variables as instrumental variables for fertility so that I estimate the effect of fertility on child/mother's health status using the new data set for Tanzania 2015.
Could you please help me some commands?

Thank you
