I am interested in analyzing biomarker data of MIS Kenya of 2015.

I will to seek anyone's advise on - Malaria microscopy results for children who were tested. It was reported that parasite counts were done in final MIS 2015 Kenya but I could not find the actual parasitemia counts in the MIS 2015 data. Column HML32 - in KEPR7HFL has microscopy results recorded as yes/no (not counts) and HML35 - has RDT results (yes/no). Can I get the actual parasitemia counts for the children who were tested positive for malaria by microscopy.

Following is a response from Senior DHS Data Processing Specialist, Mianmian Yu:

Thanks for the question, but actual parasite counts in 2015 Kenya MIS are not available for distribution purposes.
