Dear

I am using the Ethiopian 2016 DHS and I couldnt match the table 11.8 "among youngest children age 6-23 months living with the mother". The total number in the table includes 2960 children while I am getting 3075 after applying the following command in stata.

```
use "C:\Users\UserPc\Desktop\thesis\stata 2016\diet diet.dta" , clear  
gen age = v008-b3
```

```
* select on the living children 6-23 month  
keep if age<24 &age>5 & b5==1
```

```
* regroup age  
recode age(0/5=.) (6/8=1 "6-8") (9/11=2 "9-11") (12/17=3 "12-17") (18/23=4 "18-23") (24/59=.),  
gen(child_age)
```

```
tab child_age  
tab child_age[iw=v005/1000000]
```

```
* Keep only those living with their mother  
keep if b9==0
```

```
* for checking if the child is the youngest  
drop if _n > 0 & caseid == caseid[_n-1]
```

```
tab child_age  
tab child_age[iw=v005/1000000]
```

Can you please explain to me how I can get the exact number and percentage as the table in the report.  
Thank you

Dear User,  
Please take a look at this post by Trevor Croft:  
<https://www.dhsprogram.com/data/calculating-the-age-of-children.cfm>  
If you still need assistance please post again.  
Thank you!

Try the following:

- \* keep if under 24 months and living with mother
  - keep if `b19 < 24 & b9 == 0`
  - \* and keep the last born of those.
  - \* if caseid is the same as the prior case, then not the last born
  - keep if `_n == 1 | caseid != caseid[_n-1]`
-
