Hello!

I'd like to construct a var indicating the number of children born before age 20 of mother's. Thank you for telling me how I can construct them.

Best regards

A response from Technical Specialist, Dr. Shireen Assaf,

Quote:

Dear user,

You would need to use the BR or KR file and code the variable to obtain the number in the following way. BR is all births and KR are births in the last five years. I call the variable child420 which gives the number and percentage of children born before the mother was age 20.

Stata code:

gen agem=b3-v011 gen agemyr = int((agem) / 12) gen childb420=0 replace childb420=1 if agemyr<20 ta childb420

Thank you.

Best,
