Hi, please I am interested in Table 17.8.1 and would want to know how the variables were computed for "Forms of spousal violence: women" which is the percentage of ever-married women age 15-49 who have experienced various forms of violence ever or in the 12 months preceding the survey, committed by their husbands/partners.

Dear User,

Which dataset are you analyzing?

Thanks!

I am using Haiti data but i don't understand how find the sample for patner violence. According to me, it should be te sample interviewed minus the single women. I try this i can't find the sample number as the report.
