Subject: Creating mean regional value for open defecation Posted by Annb on Thu, 09 Aug 2018 13:24:34 GMT

Hi,

I am conducting logistic regression analysis on various indicators surrounding sanitation in SPSS and want to calculate the mean regional prevalence of open defecation. Am I able to do this by simply creating an interaction variable or is there a way of doing this which creates a more specific output for each region which I can then add as a covariate to my model?

Many thanks, Ann
