Please, I need help here,

I am currently working on a research paper using the NDHS 2003, 2008 and 2013. I need the Stata command for extracting the variable for measuring neonatal and infant mortality using the B6 variable or any other appropriate variable.

I am examining the changes in the influence of socioeconomic factors on neonatal, infant and child mortality within these survey periods. I intend using B5 for measuring child mortality

Thank you so much for the detailed information.

I will try following the steps.
