Hello:

When the 2015 Nigeria Malaria Indicator Survey data (Household member recode file or children's file) and the 2015 Nigeria GPS datasets are merged using their cluster numbers (HV001 in survey data and DHSCLUST in GPS data) using spss. I will be getting this error message as i want to do further analysis ERROR: Missing value(s) found in XC or YC variable(s). Missing values not allowed for coordinate

variables. I think this is because they have different cluster numbers. Please i need help maybe i might not be merging them properly .
