Hello, I am working on a research that how facility delivery affects infant mortality in Zambia. I have merged dataset and my infant mortality variable which is B6 has about 500 observation, and also I am looking less than a month old mortality that made the variable of B6 observation numbers less than 200. However, the report data saying that there is more than 1000 observation. How can I reach this more than 1000 observations data for infant mortality in Zambia?

Dear User, the best place to start is with The Guide to DHS Statistics and The Standard Recode Manual
You can also search the forum for key words for similar posts. You can also post your code to The DHS User Forum. Someone may be able to help. Thank you!
