Subject: Stata code for measuring neonatal death rate
Posted by Ghose on Thu, 11 Oct 2018 23:29:55 GMT

Hi,

I am working with Ethiopia dataset and to measure the rate of neonatal death using STATA. Can anyone share the code to do this.

The problem is that I want to measure ND per 10,000 live births but not sure how can I manage the data on live births.

I would also like to know whether weighing makes any difference in the rate of ND.

Thanks in advance for your insight!

Dear User, You can search the forum for this topic. Start by looking at this thread.. You may also want to reference The Guide to DSH Statistics.
Thank you!
