Hello Everyone,

I'm currently working on DHS data for a couple of topics but I'm currently stuck and I need your urgent help with some specific questions.

- 1) Is the male and female data set independent from each other or they are from the same household?
- 2) Can I compare contraceptive use from the male data set with the female data and not worry about overlapping, if they are both from the same household?
- 3) From which variable or variables do I get to generate maternal mortality?

Thank you very much.
Abdel
