I am using the Nepal DHS, 2001 data set. Are the variables v106 and v133 of women individual questionnaire different? I categorized v133 into 0' No Education' 1'Primary (grades 1-5)' 2'Some secondary (grades 6-9)' 3 'SLC and above (grade 10+)'. I run the both variables v106 and v133 but the frequency of no education did not match. Any suggestion?
