Hello,

I am doing my thesis on the determinants of help seeking behaviour of victims of spousal violence in 10 countries that include the domestic violence module in DHS. However, i am new in using STATA and i have a very limited knowledge. i am trying to do table 2.11 (Among women who have ever experienced violence by anyone, percentage who never sought help from anyone and percentage who sought help from specific sources, by source(s) from which help was sought) in the publication "in the help seeking section in the publication "profiling domestic violence: a multi-country study" but i'm not figuring out how to do it. i was wondering if you could help me create such a table in STATA or what proper command to use.

i also wanted to know if using the weight is necessary when running my regression.

Thank you
