Dear all, we were working on Sexual and Reproductive Health of Adolescents and Youth in Nepal:Further Analysis of the 2011 Nepal Demographic and Health Survey. ASFR for 20-24 years old is different from the reported on the further analysis report using the reduced data(15-24 years) but it was identical when full data(15-49 years) was used. There was no problem for ASFR of 15-19 years old when reduced data was used. we are looking for the appropriate reasons behind this result. Thank You.
