
Subject: Pooled data: which weight to use

Hi,

For our analysis, we are using women's information, women's husband information and women's children information. We are pooling those information from different countries from different regions, therefore we are using denormalised weights as instructed. Right now we are only using the women's denormalised weight. Should we be doing anything else as we are combining information about the men (the women's husband)?

Thank you for your help!
