Hello,

I am trying to replicate Table 16.4 Prevalence of circumcision and age at circumcision: girls age 0-14 in the 2015-16 Tanzania final report. Specifically, I am trying to get the age of cutting for daughters. I am working with the BR dataset. Looking at the variable g121 (is daughter circumcised) the total is 10,340 versus the total number of girls in table 16.4 being 11,795, and I cannot figure out why these totals are different. If you can provide me suggestions and/or Stata code on how to replicate this table and get information on the prevalence of circumcision and age at circumcision for daughters, that would be much appreciated.

Thank you!
