Subject: Merging all DHS recode files for one country in Stata
Posted by Tim DHS user on Wed, 10 Apr 2019 03:03:42 GMT

Hi everyone :)

Could anyone please assist me with regards to the code for merging all of the DHS recode files for one country to create a cross-sectional dataset?
I'm a first-time user of the DHS data, and I' using the DHS 2016 data for South Africa to investigate gender differences in non-communicable diseases.
I've managed to do some individual merges (for example, HR and KR recode files) but I haven't been able to find anything on merging ALL of the recode files.

Any help would be greatly appreciated.

Tim
