Hi,

I'm interested in using the modeled surfaces that DHS makes available through the Spatial Data Repository. I was wondering, if an indicator has been modeled for one country but not for another, does that mean that you tried to model it but it didn't produce good results, that you haven't modeled it yet but will eventually, or that that particular indicator/country combination is not a priority? Are we allowed to request that you model particular indicators in particular countries? Or can we request the code used to produce one surface in a particular country so that we can use it with a different survey/country?

Thanks,

Josh
