Subject: Co-occurrence of stunting & anemia, Stunting & overweight & obese among under five children
Posted by Alinoor on Mon, 15 Jul 2019 15:21:57 GMT

Greetings!

I'm trying to generate a variable from two different variables. i.e a variable that has both stunted and overweight children. I came up with the following STATA codes but not sure if it is correct.

```
gen stunting_overweight=.
replace stunting_overweight =1 if stunting==1 & baz1==1
replace stunting_overweight =0 if stunting==1 & baz1==0
```

see the below table used as a reference when generating the variable

```
-------------------------------
         |      baz1
 stunting |    0     1  Total
----------+--------------------
       0 | .8916 .1084     1
         | 5036   716  5752
         |
       1 | .9483 .0517     1
         | 3004   219  3223
         |
   Total | .9131 .0869     1
         | 8040   935  8975
-------------------------------
```
