Hi All,

I am trying to use the variable m57a-u in the births file of the Haiti 2016-17 DHS survey to classify antenatal care-seeking by facility type. It appears that the variable labels in the recode dataset were not updated to reflect the country specific changes in the paper version of the questionnaire. Many of the labels say "antenatal care: cs public health", but don't specify which country specific facility type this data represents. Is it possible to get more detailed information on what these variables represent? I have been working with multiple countries and so far I haven't found this issue with other data sets so it appears to be an issue specific to Haiti 2016/17. Any additional information would be much appreciated!

Thanks!
Ashley
