Subject: Survey weighted tables

Hi. I am using Pakistan dataset 2017-18. When I try to tabulate the frequencies according to the demographics I am facing a problem with the region. When I create two-way tables with types of domestic violence and regions I get proper numbers but when I try to do the same applying survey weights it gives me '0' for Gilgit and Azad Jammu and Kashmir regions. Why is that? I have attached the image of the output.
