Hello,

I'm working with Senegal 2015 raw facility, provider and family planning files, and trying to recreate the variable that is similar to v2002a and v2000a, from Senegal recoded 2012: "fp: n providers per service" and "number of eligible providers" but cannot figure out how this was calculated from the facility raw files. I tried to merge in number of eligible FP providers from the "Staff/listing provider file", raw, but the numbers of providers eligible on day of survey/assessment do not match up. Please let me know how best to code variable from the raw Senegal 2015 files. Thank you.
