Hello,

I am trying to calculate the median birth interval using STATA from the NFHS-4. However, I am getting the wrong median compared to the report. The report says the median in India is 32 months, however, I am getting 28 months.

I am subtracting 9 months from the variable as I want birth-to-pregnancy interval, not birth-to-birth. But even if I don't subtract 9, I get different values.

```
use IABR74FL.dta
gen weight=v005/1000000
```

```
rename sdistri shdistri
tostring shdistri, replace
gen strata = shdistri
svyset v021 [pweight=weight], strata (strata)
```

```
keep shdistri v008 b3 bord b0 b11 v106 hv024 v025 v190 v447a v133 s301 hv001 hv002 hvidx
v005 v021 weight strata
```

*Births in the month of interview are included and births 60 months before the interview are excluded.

```
gen monthssncbirth=v008-b3
replace monthssncbirth=. if monthssncbirth<=60
drop if monthssncbirth==.
```

*First-order births (and their twins) are excluded from both numerators and denominators.

```
svy: tab bord
gen birth_order=bord if (b0 > 1)
svy: tab birth_order
```

*subtract by 9 months to find birth-to-pregnancy interval (WHO)

```
gen birth_interval=b11-9
replace birth_interval=. if birth_interval<0
```

Hello,

I am trying to calculate the median birth interval using STATA from the NFHS-4. However, I am getting the wrong median compared to the report. The report says the median in India is 32 months, however, I am getting 28 months.

I am subtracting 9 months from the variable as I want birth-to-pregnancy interval, not birth-to-birth. But even if I don't subtract 9, I get different values.

Code: [Select all] [Show/ hide]

```
use IABR74FL.dta
```

```
gen weight=v005/1000000
```

```
rename sdistri shdistri
```

```
tostring shdistri, replace
```

```
gen strata = shdistri
```

```
svyset v021 [pweight=weight], strata (strata)
```

```
keep shdistri v008 b3 bord b0 b11 v106 hv024 v025 v190 v447a v133 s301 hv001 hv002 hvidx  
v005 v021 weight strata
```

*Births in the month of interview are included and births 60 months before the interview are excluded.

```
gen monthssncbirth=v008-b3
```

```
replace monthssncbirth=. if monthssncbirth<=60
```

```
drop if monthssncbirth==.
```

*First-order births (and their twins) are excluded from both numerators and denominators.

```
svy: tab bord
```

```
gen birth_order=bord if (b0 > 1)
```

```
svy: tab birth_order
```

*subtract by 9 months to find birth-to-pregnancy interval (WHO)

```
gen birth_interval=b11-9
```

```
replace birth_interval=. if birth_interval<0
```

Would appreciate some help please.

Thanks in advance.

DHS staff are very busy right now, and we will try to answer in a couple of weeks?

Following is a response from DHS Research and Data Analysis Director, Tom Pullum:

Instead of the BR file, use the KR file to get births in the past five years. Look at the distribution of b11. There are some very short intervals and I would edit them out. Then enter the following line in Stata:

```
summarize b11 [fweight=v005] if b11>9, detail
```

The 50th percentile is 32 months. That matches the report.

To get a birth-to-pregnancy interval you could subtract 9 months, but that would be the interval to pregnancies that resulted in a live birth, and presumably you would want to include all pregnancies, not just those that resulted in a live birth. For that you would need to use the calendar, and probably include current pregnancies. That's more complicated, partly because of left censoring.
