Dear all,

I have a problem while calculating the above-mentioned prevalences in R-studio.
For instance, I use data from DHS India 2006, R gives me a value of 37.5% for stunting prevalence (weighted) and 43.5% stunting prevalence (unweighted).
The official value by stat compiler is 48%. But somehow if I calculate stunting prevalence with stata it gives me 42% stunting prevalence (weighted) and 38% unweighted. Why are the R values so different from the Stata values?

I hope someone can help me.

Best regards,
StatMo

Hello StatMo,

Please try the following do file for 2015-16. It may point you in the right direction.

All the best

Dear Dr. Tsawe,

Many thanks for your quick reply!
However, I don't get how this should get me in the right direction.
I think my problem lies within R as stata gives values that are close to the values of the statcompiler ones.
For the other countries, the R values are fine.

Best regards,

StatMo

Hi.

I can't help you there. I do not use R.
