HELLO.

I have some questions about TOGO 2017 MIS data use.

i am working on factors associated(household factors and mothers factors) with anemia in children aged 6 to 59months.

by running the data, i realized there are several codes for one variable with a different number of participants.

so i would like to know which code i should consider for the following variables:

- about Children from 6 to 59months: sex, age in months, hemoglobin test result, malaria test result.

- about mothers: marital status, highest education level, hemoglobin test result, malaria test result.

thank you
