Hello,

My group and I are trying to replicate the results published in Table 10.7 of Turkey 2013 Report. We are using variable m51, restricting to values 100 to 148, 201 and 202 (postnatal care in the first two days of birth).
However, our estimate has a huge diference in relation to the published one.

We tryied to estimate it considering the last birth in the five years preceding the survey, to replicate the published estimative, but the result was 52.8% (N=2,603).

Using the standard definition, considering women age 15-49 giving birth in the last two years preceding the survey, result was 54.8% (N=1,227).

What can we be considering different from Turkey 2013 report?

Thanks in advance,

ICEH
