Hello

We conducted an analysis of NFHS-4 data set at the household level on the basis of age, height, weight, education of men, women, and children. Accordingly, we merged the IR file with the PR file then we making this (IR+PR) file as a household file, through the reshaping the IR+PR file but we are unable to do this, please tell me how to reshape this file or how to make household file from IR or PR file. Please help me out

Thanks and regards,
Ajinkya
