Greetings to DHS/SPA expert community,

I am working on an analysis of the recent DRC SPA (2017-18). I need your help to better understand the data. I'd appreciate your support. Here are my questions:

- I need to analyze the exit interview data set. I am using the weight and strata as follows:

gen strata=factype * province
gen clientweight=clientwt/1000000

svyset facil [pweight=clientweight], strata(strata)

Is this the right way of using the correct sampling weight?

I appreciate your help,

Saleh
