Hi,

I am currently working on BDHS dataset.

I want to create a variable 'prenatal visits' as an independent variable for my regression, using IR file.

But, there too many variables (m2a_1, m2b_2 etc etc) and types (doctors, nurses, medical assistant etc) that I am confused how to combine them and construct an overall variable, which will indicate:

Prenatal visits: 'yes/no'..

Would you kindly provide the STATA command for my quires?
