Hello,

I am using the KENYA SPA MCHIP survey as my unit of analysis and I merged some variables from the facility survey and the health worker interview survey. I noticed that in the MCHIP dataset there is the variable c005 which represents the sample weight but it is different from the v005 sample weight of the facility dataset. I was wondering, which one should I use to generate the weight variable for my analysis?

Moreover, I have a question regarding missing data. I saw that in the dataset there are two variables (scd100 and scd200) that indicate whether section 1 and section 2 were observed. Is there a particular reason why these sections were not observed?

thank you,  
Lucia
