Hello,

I am working on Women Empowerment and Domestic Violence for the 2001-02 to 2018 Zambia DHS. I am facing two challenges with regard to my analysis and I am hoping for your assistance. I am using the woman file (Individual recode).

1) I have managed to replicate 2 out of 3 indicators of interest among women on Table 16.11 on page 306 of the Zambia 2018 Main Report. The indicators are on attitudes toward negotiating safer sexual relations with husband. I have not been able to replicate the 3rd indicator on "percentage of women who believe that a woman is justified in refusing to have sexual intercourse with her husband if she knows he has an STI". I cannot see the variable which was used to run the indicator (the report has a total of 60.4 percent on Table 16.11). I thought the indicator which was used is V633a (country specific indicator) but the STATA output indicates that the indicator has no observations when I run it. Kindly assist on the variable

Dear User, Please check out this link. It contains Stata code to produce Demographic and Health Survey Indicators. If you don't find what you need here, please post again.
Thank you!

Thank you very much for the link. It will be useful in my further analysis.

I have checked the codes for the do-file and used the appropriate syntax to run for the 2013-14 IR. However, i am still getting the same results as before for the two aspects that i mentioned in my initial post.

With regard to my second challenge, i have seen that variables v633b ("Refusing to have sexual intercourse with her husband if she knows he has sex with other women") and v822 ("Asking that they use a condom if she knows that her husband has an STI") were used in the link you shared to produce the first two indicators in Table 16.11 on page 306 of the Zambia DHS main report, just like what the Guide to DHS indicates. However,
