ICRW, on behalf of the Global Stigma and Discrimination Indicator Working Group (GSDIWG), recommends the replacement of the 'AIDS virus' phrase with 'HIV' in all questions where it currently appears in the HIV module, including questions: 902, 903, 904, 905, 906, 907, 914, 915, 916, 921, 922, 924, 926 and 930.

Rationale for change: Technically, AIDS is not a virus, HIV is. Thus, using the terminology 'AIDS virus' is technically incorrect and could foster confusion and misunderstanding of the difference between HIV and AIDS, resulting in poor quality data. In addition, the term 'AIDS virus' is stigmatizing, as it infers that people living with HIV will all progress to AIDS. The 'AIDS virus' language can also foster stigma by directly linking HIV and AIDS in respondent's minds. Given the negative association of AIDS with a long, debilitating death, the term often inspires fear, which is a key driver of stigma towards people living with HIV. In 2011, UNAIDS recommended that HIV and AIDS not be linked directly and that the term most specific and appropriate to a given situation be used in its Terminology Guidelines (See: http://www.unaids.org/en/media/unaids/contentassets/document/s/document/2011/20111009_UNAIDS_Terminology_Guidelines_MidtermAdditions_en.pdf) . Moving forward, the outdated 'AIDS virus' terminology should be replaced with 'HIV'.

On behalf of the Key Populations team at USAID Office of HIV/AIDS, I would like to support the changes ICRW has requested to remove the dated, inaccurate AIDS virus language.

Cameron Wolf, PhD, MSc
Senior HIV/AIDS Advisor for Key Populations
USAID Office of HIV/AIDS

On behalf of the Health Policy Project, I am writing to support removal of the term "AIDS virus". While it may have been helpful a decade ago to use this term to ensure respondents understood the questions, it is no longer necessary. We also know from the past decade of research that equating HIV and AIDS only serves to further stigma.
